Antihyperlipidaemic Activity of Spermacoce Hispida Ethanolic Extract in Triton WR-1339 Induced Hyperlipidaemic Rats

G. Sivaelango, P. Senthil Kumaran, P. Kumaravel, P. Revathi and A. Jaswant

ABSTRACT

Hyperlipidaemia is the greatest risk factor of coronary heart disease. Currently available hypolipidaemic drugs have been associated with number of side effects. Herbal treatment for hyperlipidaemia has no side effects and is relatively cheap and locally available. Literature claims that Saponins are able to reduce hyperlipidemia. Based on high saponin content in herbal plants, Spermacoce hispida (S. hispida) was selected and the present study focus on the antihyperlipidaemic activity of Ethanolic seed extract of S. hispida against triton-WR-1339 induced hyperlipidaemia in rats. Hyperlipidaemia was induced in Wistar rats by intraperitoneal (i.p) injections of Triton WR-1339 at a dose of 400 mg/kg body weight. S. hispida was administered orally at a dose of 200 mg/kg to triton WR-1339 induced hyperlipidaemic rats. After administration of S. hispida shows a significant decrease in the levels of cholesterol, phospholipids, triglycerides, LDL, VLDL and significant increase in the level of HDL in serum and liver tissues against triton induced hyperlipidaemia in rats. Therefore it effectively suppressed the triton induced hyperlipidemia in rats, suggesting the potential protective role in Coronary heart disease.

Keywords: Hyperlipidaemia, Triton WR-1339, S. hispida, Cholesterol.

INTRODUCTION

Hyperlipidaemia mainly increased level of cholesterol or low-density lipoprotein cholesterol (LDL-C) contributes significantly to the manifestation and development of atherosclerosis and coronary heart diseases (CHDs). Cardiovascular diseases, including atherosclerosis, are the most common causes of mortality and morbidity worldwide (Yokozawa et al., 2003). Approximately 12 million people reportedly die of cardiovascular disease each year worldwide. Although several factors such as diet high in saturated fats and cholesterol, age, family history, hypertension, and lifestyle play a significant role in causing heart failure, the high level of cholesterol, particularly LDL-C is mainly responsible for the onset of CHDs (Yokozawa et al., 2003, Farias et al., 1996). The lowering of lipids and cholesterol levels by drug or dietary interventions could reduce the risk of CHDs. The known lipid-lowering drugs (fibrates, statins, bile acid sequestrants, etc.) regulate the lipid metabolism by different mechanisms, but they also have many side effects (Chattopadhyaya et al., 1996). Therefore, the development of lipid-lowering drugs from natural sources is the best option and is in great demand. Medicinal plants continue to provide valuable therapeutic agents, both in modern medicine and in traditional systems.
Plants and many plant derived preparations have long been used as traditional remedies and in folklore medicine for the treatment of hyperlipidaemias in many parts of the world. There are many plants and their products that have been reputedly and repeatedly used in Indian traditional system of medicine. Recently, the search for appropriate antihyperlipidemic agents have been again focused on plants because of less toxicity, easy availability and easy absorption in the body that may be better treatment than currently used drugs (Newman et al., 2004). Plants that were once considered of no value are now being investigated, evaluated and developed in to drugs with no side effects. One of such plant is S. hispida Linn commonly known as ‘Shaggri button weed’ belongs to the family Rubiaceae and is widely distributed throughout the world as a useful medicinal plant (Narayan et al., 2003). The seeds of plants as confection are cooling demulcent and given in diarrhea and dysentery. Seeds have been recommended as a substitute for coffee. Seeds are crushed in to paste and taken orally to treat stomach problems (Chellaiah et al., 1999). According to some studies, S. hispida Linn has also anti hypertensive activity (Arnold and Schmidt, 2003). The plant has been extensively studied for its phytochemical composition and a large number of active ingredients such as, Borrelina, β-sitosterol, Ursolic acid and Isorhmmatin. Recently, pharmacological studies have shown that S. hispida seeds exhibit anti diabetic properties in rats (Kaviarasam et al., 2008). Hence, in the present study, the ethanolic extract of S. hispida seeds was investigated for Antihyperlipidemic activity in triton WR-1339 induced hyperlipidaemic rats.

MATERIALS AND METHODS

Collection of plant material and extraction

The seeds of S. hispida were collected from Gobichettipalayam. The plant material was deposited at the Herbarium of Botany department, PSG college of Arts and science, Coimbatore. The dried seeds were made into fine powder with an auto-mix blender and were kept separately in an airtight container until use. The powder was exhaustively extracted with ethanol in the ratio of 1:5 (w/v) for 24 hr by using soxhlet apparatus. The extract was completely evaporated to dryness using rotary flash. This extract was dissolved in 5% carboxy methyl cellulose (CMC) solution and used in the study.

Animals

Eight week old adult male albino rats of Wistar strain, weighing approximately 150 to 200 g, were acclimatized for 7 days at room temperature (22±2°C) and humidity of 45-64% in a 12-hour light/dark cycle in a room under hygienic condition (Kumaravel et al., 2010). They were given access to water and a commercial diet ad libitum. The experiments were carried out in the Department of Pharmacology, Periyar college of Pharmaceutical science for girls, Trichy, as per the guidelines of Committee for the Purpose of Control and Supervision of Experiments on Animals (CPCSEA), New Delhi, India, and approved by the Institutional Animal Ethics Committee (IAEC).

Chemicals

Triton WR-1339 (A non-ionic detergent, Isooctyl polyoxyethylene phenol) was obtained from Sigma Chemicals Co, Mumbai.

Induction of hyperlipidaemia

Hyperlipidaemia was induced in Wistar rats by intraperitoneal (i.p) injections of Triton WR-1339 at a dose of 400 mg/kg body weight. After 72 hours of triton injection received a daily dose of 5% CMC in 5ml/kg body weight for 7 days (Sundarraj et al., 2010).

Experimental design

In the experiment, the rats were divided into three groups of eight rats each. Group I rats received 5% CMC and considered as controls, Group II rats were treated with Triton WR-1339 (400 mg/kg body weight; i.p.) (Sundarraj et al., 2010) and Group III rats were treated with Triton WR-1339 (400mg/kg body weight) and ethanolic extract of S. hispida seed (200mg/kg body weight) (Rathi et al., 2010).

At the end of 8th day, rats were fasted overnight and sacrificed by cervical dislocation. Blood was collected, and serum were separated by centrifugation. Liver tissues were excised immediately and rinsed in ice-chilled normal saline, 500mg of the tissues were homogenized in 5.0 ml of 0.1 M Tris–HCl buffer (pH, 7.4). Biochemical estimations were carried out in serum and liver tissues, parameters such as cholesterol (Zak’s, 1977), phospholipids (Rouser et al., 1970), triglycerides (Rice, 1970), LDL (Friedwald Levy and Frederickson, 1972), VLDL (Henry et al., 1998) and HDL (Varley et al., 1980) were analyzed.

Statistical analysis

Statistical analysis was performed using one-way analysis of variance (ANOVA) followed by Duncan’s multiple range test (DMRT) using SPSS software package 9.05. Results were expressed as mean ± SD from 8 rats in each group. P values <0.05 were considered as significant.

RESULT

The results were discussed under the following headings. Lipid profile in serum and liver tissues. Table 1 shows the levels of cholesterol and phospholipids were found to be significantly increased in serum and liver tissues of triton induced rats when compared to control rats. These levels were found to be significantly reduced in hyperlipidaemic rats treated with ethanolic seed extract of S. hispida. In triton induced rats the levels of triglycerides, LDL and VLDL were significantly higher in serum and liver tissue when compared to those in control rats, while the HDL levels were significantly decreased when compared to control rats. After the treatment with ethanolic seed extract of S. hispida at the doses 200 mg/kg in the Triton induced rats, a significant reduction in LDL, VLDL and significant increase in HDL were observed when compared to control rats were shown in the table 2 & 3, respectively.
Hyperlipidemia is associated with heart disease, which is the leading cause of death in the world. The lowering of the levels of harmful lipids to satisfactory values have been confirmed by several experimental animal and intervention studies indicating lowered morbidity and mortality in coronary heart diseases. Several studies reveal that an increase in HDL cholesterol and decrease in cholesterol, LDL cholesterol and triglycerides is associated with a decrease in the risk of ischemic heart diseases (Kellner et al., 1951). Triton WR-1339 has been widely used to block clearance of triglyceride rich lipoproteins to induce acute hyperlipidemia in several animals (Schurr et al., 1972). The present investigation shows that all triton induced rats displayed hyperlipidemia as shown by their elevated levels of serum and liver cholesterol, triglycerides, phospholipids and the reduction in the HDL level. Most of the antihyperlipidemic drugs are causing significant reduction in both total cholesterol and increase in HDL cholesterol levels (Fiser et al., 1951). Triton WR-1339 has been widely used to block clearance of triglyceride rich lipoproteins to induce acute hyperlipidemia in several animals (Schurr et al., 1972).

The present investigation shows that all triton induced rats displayed hyperlipidemia as shown by their elevated levels of serum and liver cholesterol, triglycerides, phospholipids and the reduction in the HDL level. Most of the antihyperlipidemic drugs are causing significant reduction in both total cholesterol and increase in HDL cholesterol levels (Fiser et al., 1951). This model is widely used for a number of different aims (Ye- Yuli et al., 2005) particularly, in rats it has been used for screening natural or chemical hypolipidemic drugs (Harbowy and Balentine, 1997). In fact, flavonoids, steroids, saponins and anthocyanin, a heterogeneous group of ubiquitous plant polyphenols have exhibited a variety of pharmacological activities including the antiatherogenesis. The plant steroids reduce the absorption of cholesterol and thus increase faecal excretion of cholesterol (Del et al., 2005). Lupeol, a triterpenoid was reported for its cardioprotective activity against experimental hypercholesterolemia (Sudhakar et al., 2007). Interestingly, the results of the present study show that ethanolic extract of S. hispida seeds reduces the level of cholesterol, triglycerides, phospholipids and increase the level of HDL, which may probably be due to the presence of steroids, flavonoids and triterpenoids.
